CASE STUDY

The DentaQuest Health-Data Breach of May 2026: A Case Study

A TeamStarWolf case study. Published 11 November 2026; every source checked as of that date.

Executive summary

The people in this breach are current and former dental and vision plan members, including Medicaid and Medicare enrollees, children and people who have died [1] [4] (**Confirmed**). In July 2026 DentaQuest told regulators that more than 15 million people's protected health information was accessed [1], and filed separate letters for adults, minors and deceased individuals [4] (**Confirmed**). On the 11 November HHS breach portal export, 15,000,000 is the year's largest entry [8] (**Confirmed**).

The intrusion was short and needed no malware. Per DentaQuest's counsel, social engineering got one employee to hand over credentials and a multifactor authentication code; from 17 to 19 May 2026 the actor took data from a network file share; forensics found no malware, privilege escalation or other compromised accounts [1] (**Confirmed** as the victim's statement to a regulator). DentaQuest learned of it on 20 May, when a third party claimed to hold its data [1] (**Confirmed**).

ShinyHunters claimed the theft and published the data [14] (**Reported**); DentaQuest's filings never name the actor [1] (**Confirmed**). No CVE or KEV entry applies: this was an identity failure, not a software flaw (**Inferred** from [1]).

Key facts at a glance

Field	Value
Victim	DentaQuest, LLC, a health plan in Massachusetts on the HHS portal [8] (**Confirmed**); part of Sun Life U.S. Dental, owned by Sun Life Financial [14] (**Reported**)
Intrusion window	17 to 19 May 2026 per counsel and Oregon [1] [6]; "ended by May 20" per DentaQuest's consumer notice [2] (**Confirmed**; the victim's documents disagree)
Entry vector	Social engineering of one employee for credentials and an MFA code; channel (phone or email) not stated [1] (**Confirmed**)
Systems affected	Data exfiltrated from a network file share; operating systems not affected [1] (**Confirmed**)
People affected	15,000,000 per HHS [8] and Oregon [6]; "more than 15 million" per counsel [1] (**Confirmed**)
Claimed by	ShinyHunters, about 234 GB claimed [14] (**Reported**); listed as "Claimed Actor" in an Indiana state brief [9] (**Confirmed** as Indiana's listing of a claim)
ATT&CK group (context only)	G1057 ShinyHunters; ATT&CK does not list DentaQuest [23] (**Confirmed**)
CVE and KEV	None applies [1] [12] (**Inferred**)
Regulator status	Under HHS OCR investigation [8] (**Confirmed**)

Key findings

- **One employee and one code were enough.** Counsel's letter puts the entire entry on a single employee who gave up credentials and an MFA code [1] (**Confirmed**). A code a person can read out is phishable by design (**Inferred**).
- **The victim learned from the extortionist.** Activity ended on 19 May; DentaQuest "became aware of" a third party claiming to hold its data on 20 May [1] (**Confirmed**). Nothing in the record shows internal detection (**Inferred**).
- **A file share held years of enrollment data.** Much of the leak was ASC X12 enrollment files, some with Medicaid IDs [13], and reportedly reaches back to at least 2009 [16] [17] (**Reported**). Retention and share scope, not exploit code, set the size of this breach (**Inferred**).
- **The headline numbers disagree, and only one is a regulator count.** 15,000,000 is the figure filed with HHS and the states [1] [6] [8] (**Confirmed**); 2.6 million counts email addresses in the leak [13]; 23.4 million is a third party's dedupe of name and date-of-birth pairs, about two thirds already in earlier breach corpora [21] (**Reported**).

Top recommendations

1. Move staff with access to member data to phishing-resistant MFA [1] (**Inferred** from the entry vector).
2. Scope and age-out enrollment file shares; files reportedly dating to 2009 [16] should not sit on a share a single user can bulk-read (**Inferred**).
3. Alert on bulk file-share reads and large outbound transfers, so the first signal is not an extortion message [1] (**Inferred**).

4. Plan notification for minors and decedents before an incident [4] (**Inferred**).

Scope and method

This brief covers the May 2026 DentaQuest intrusion, its attribution, the count dispute and the response through 11 November 2026. The sector picture is in the Healthcare Threat Watchlist [24]. Tradecraft is described at advisory level; the actor's leak site was not visited.

Grade	Meaning in this study
Confirmed	Stated in a primary opened for this study: victim filings and notices, government listings and briefs, a company release, ATT&CK or library data. A victim's account of its own investigation is Confirmed as that victim's statement
Reported	Journalism, third-party analysis (including Have I Been Pwned), the actor's claims, or a secondary account of an unopened primary
Demonstrated	Not used: no lab work or reproduction applies to this incident
Inferred	This study's own reasoning from cited facts, labelled where it appears

Part 1: what happened

Date (2026)	Event	Sources	Grade
17 to 19 May	After one employee is socially engineered, the actor accesses a limited portion of the network and exfiltrates data from a file share; activity ends 19 May	[1] [4] [6]	Confirmed
20 May	DentaQuest becomes aware of a third party claiming to hold its data; containment the same day	[1]	Confirmed
20 May	Per DentaQuest's July consumer notice, it "discovered" the access on 20 May and the incident "ended by May 20, 2026"	[2]	Confirmed (conflicts with [1] [6])
29 May	DentaQuest learns the data was posted on the dark web	[1]	Confirmed
30 May	ShinyHunters leak-site post last updated: about 234 GB, 2.6 million people, DentaQuest "failed to reach an agreement"	[14]	Reported
3 June	Have I Been Pwned adds 2.6 million unique email addresses	[13]	Reported
29 June	Kroll gives DentaQuest initial information on impacted individuals	[1]	Confirmed
16 July	Counsel notifies the Rhode Island AG of more than 15 million people; HHS OCR (15,000,000, Hacking/IT Incident, Network Server), California and Oregon listings dated the same day	[1] [4] [6] [8]	Confirmed
17 July	Individual notification by mail begins	[1] [2]	Confirmed
23 to 27 July	Trade press reports a 23 million estimate; SecurityWeek counts letters to at least 4.5 million people in three states' filings	[16] [17] [18]	Reported
11 November	HHS export: 15,000,000 is the largest 2026 entry, ahead of Aesto (9,540,683) and iRhythm Technologies (8,179,772)	[8]	Confirmed

Part 2: the intrusion record

The mechanism of the intrusion comes from one document: counsel's 16 July letter to the Rhode Island Attorney General [1] (**Confirmed**). It says social engineering tricked a single employee into providing credentials and a multifactor authentication code, in violation of company policy. CrowdStrike Services found no other compromised accounts, no malware or ransomware, no privilege escalation and no added persistence, and operating systems were not affected [1] (**Confirmed**).

The letter does not say whether the lure came by phone or by email, what kind of MFA was in use, which remote-access path the actor used with the stolen credentials, or how the data left the network [1] (**Confirmed** as absences), so no lure sub-technique or exfiltration channel is bound.

Much of the leaked data is enrollment data. Counsel's letter says the impacted data included names, dates of birth, Social Security numbers, Medicare and Medicaid identification numbers, health plan numbers and dental and vision information such as diagnosis, treatment and billing [1] (**Confirmed**). Have I Been Pwned adds addresses, phone numbers, genders and government IDs, much of it in ASC X12 enrollment files, some carrying Medicaid IDs [13] (**Reported**). HIPAA Journal and Security Affairs report a folder of more than 1.7 million SSNs a researcher ties largely to Texas children, and files back to at least 2009 [16] [17] (**Reported**).

DentaQuest's separate letters for minors and deceased individuals [4] confirm that children and decedents were in scope (**Confirmed**).

Containment came on 20 May, and monitoring since has found no further threat actor activity [1] (**Confirmed**); systems stayed operational throughout [14] [19] (**Reported**). The record names no patch and no product version because there was nothing to patch [1] [12] (**Inferred**).

Part 3: who and why

Attribution here is a claim.

- **The victim.** DentaQuest's filings and notices call the attacker only a "Threat Actor" or an unauthorized third party and never name a group [1] [2] (**Confirmed**).
- **The claimant.** ShinyHunters claimed about 234 GB on its leak site and said DentaQuest "failed to reach an agreement" [14]; Security Affairs and Have I Been Pwned describe pay-or-leak extortion [13] [15] (**Reported**).
- **State government.** Indiana's August brief lists "Claimed Actor: ShinyHunters" and financial extortion [9] (**Confirmed** as Indiana's listing; the attribution is still a claim).
- **Federal government.** The FBI's 15 May PSA on ShinyHunters covers an education-sector attack and does not name DentaQuest or healthcare [10] (**Confirmed**); no federal advisory naming DentaQuest was found.
- **ATT&CK.** G1057 ShinyHunters is a criminal collective that gathers credentials and PII for resale or extortion, tied to "The Com" alongside G1015 Scattered Spider and G1004 LAPSUS$ [23] (**Confirmed** as ATT&CK's description). ATT&CK does not list DentaQuest under G1057 or the C0059 Salesforce Data Exfiltration campaign, whose CRM pattern a file share does not match [23] (**Inferred**). Both links are context, not attribution.

Every source that states a motive says money [9] [14] [15] (**Reported** and **Confirmed** as marked above). The data's resale value is high and lasting: Social Security numbers, especially children's, are rarely reissued, and Medicaid and government IDs change slowly (**Inferred**).

Part 4: impact and response

The people. More than 15 million individuals' PHI was accessed, per DentaQuest [1]; HHS and Oregon list 15,000,000 [6] [8] (**Confirmed**). The Kroll review was still ongoing on 16 July, so the figure is a floor [1] (**Inferred** from [1]). DentaQuest serves about 32 million Americans per ISMG [14], or 35 million per SecurityWeek [18] (**Reported**).

The company. DentaQuest engaged CrowdStrike Services and Kroll, informed the FBI on 21 May, and offered 24 months of Kroll identity monitoring and restoration [1] [2] [5] (**Confirmed**). It says it has since added security measures, monitoring and employee training [2] [5] (**Confirmed** as DentaQuest's statement). Its holding statement, last updated 18 June, remains on dentaquest.com and warns members about targeted scams [3] (**Confirmed**). Sun Life's 6 August Q2 release discloses no incident or cost [11] (**Confirmed**).

Regulators. DentaQuest notified HHS OCR, gave HIPAA substitute and media notice, and notified the credit bureaus [1] (**Confirmed**). Filings sit with the Rhode Island AG [1], California AG [4] [5], Oregon DOJ [6] and

South Carolina [7] (**Confirmed**); Texas and Massachusetts filings are reported [18] (**Reported**; not opened). HHS OCR lists the breach as under investigation [8] (**Confirmed**). On 1 August ISMG still saw only a separate 3,086-person DentaQuest entry on the portal [19] (**Reported**), so the 16 July submission was posted later (**Inferred**).

Courts. Whitlow v. DentaQuest Group Inc. et al. (D. Mass.) is reported as filed on 4 June, alleging negligence and delayed notice [22] (**Reported**; docket not checked).

KEV and CVE. The Intelligence Hub feed and its May to August 2026 shards carry no DentaQuest row [12] (**Confirmed**; **Inferred** that none should, since no software vulnerability is in the record).

Part 5: the defender and vulnerability-management view

- **A CVE queue would have shown nothing.** The exposure was an identity control and a retention decision [1] (**Inferred**).
- **Treat code-based MFA as phishable.** Phishing-resistant MFA for anyone who can reach member data, plus identity checks on help-desk and reset paths, removes the code a caller can collect [1] (**Inferred**).
- **Shrink one account's blast radius.** A single user reached a share holding enrollment files reportedly back to 2009 [1] [16] (**Confirmed** for the share; **Reported** for the age). Least-privilege share permissions, retention limits on X12 extracts and data loss prevention on bulk reads follow (**Inferred**).
- **Detect the theft, not the ransom note.** Three days of access ended before DentaQuest knew [1] (**Confirmed**); file-share enumeration and large-transfer alerts would have signalled earlier (**Inferred**).

What is overstated and what is understated

- *Overstated:* "23 million affected" is a researcher's dedupe of name and date-of-birth pairs, not a regulator figure [16] [21] (**Reported**). "ShinyHunters breached DentaQuest" stated as fact goes beyond the record: the victim names no actor [1], and Indiana calls it a claim [9] (**Confirmed**). Linking the incident to the Salesforce campaign C0059 overreaches [1] [23] (**Inferred**).
- *Understated:* "2.6 million" counts email addresses, not people [13] [21] (**Reported**); the regulator figure is 15,000,000 [8] (**Confirmed**). The age of the data, reportedly back to 2009 [16] [17], and the children's records [4] [16] get less attention than the headline count (**Inferred**). The victim's own documents disagree on the end date, 19 May [1] [6] against "by May 20" [2] (**Confirmed**).

MITRE mappings

This Part binds the verified record to ATT&CK v20.0 Enterprise, CAPEC and D3FEND, with names and tactics from the library's `data/attack/` files [23]. No source describes industrial systems, so no ATT&CK for ICS techniques apply. Rows rest on counsel's letter [1] unless marked.

Groups, software and campaigns

Object	ATT&CK id	Relationship to this record
ShinyHunters	G1057	Context only: the claimant [13] [14] [15]
Scattered Spider, LAPSUS$	G1015, G1004	Context only: "The Com" in ATT&CK's G1057 description [23]
Salesforce Data Exfiltration	C0059	Context only: a different pattern (CRM data theft) [23]

No software is bound: the investigation found no malware [1].

ATT&CK Enterprise techniques

ID	Name	Tactic(s)	Dated event or report	Sources
T1598	Phishing for Information	Reconnaissance	Social engineering tricked one employee into giving credentials and an MFA code, from 17 May 2026; channel not stated	[1]
T1111	Multi-Factor Authentication Interception	Credential Access	MFA code obtained from the employee, from 17 May 2026	[1]
T1078	Valid Accounts	Initial Access, Persistence, Privilege Escalation, Stealth	The employee's credentials gave access to a limited portion of the network, 17 to 19 May 2026	[1] [6]
T1039	Data from Network Shared Drive	Collection	Data accessed and exfiltrated from a network file share, 17 to 19 May 2026	[1]
T1657	Financial Theft	Impact	Leak-site post (last updated 30 May 2026) says DentaQuest "failed to reach an agreement"; Indiana lists financial extortion	[9] [14] [15]

Fit notes (**Inferred**): T1078 and T1039 fit the counsel letter directly. T1598 gets no sub-technique because the lure channel is not stated. T1111 is a partial fit: the employee handed the code over rather than having it intercepted. T1657, whose ATT&CK description covers extortion, rests on the actor's claim and Indiana's label. No exfiltration technique, T1684.001 Impersonation or T1621 Multi-Factor Authentication Request Generation is bound, because the record describes none of them.

CWE and CAPEC

No CVE applies, so this study binds no CWE [1]. CAPEC entries the library relates to this study's techniques [23]:

CAPEC	Name	Via	Where it meets the record
CAPEC-98	Phishing	T1598	The social engineering of one employee for credentials and an MFA code [1]
CAPEC-560	Use of Known Domain Credentials	T1078	Use of the employee's credentials to reach the network [1] (**Inferred**, partial fit)

CAPEC-639, CAPEC-158, CAPEC-609 and CAPEC-651 are left out: the record describes none of their behaviors.

D3FEND countermeasures

D3FEND countermeasure	Techniques the library maps it to (from this study)	Where it meets the record
User Account Permissions (D3-UAP)	T1078	One employee's account reached a file share of member data [1]
Access Modeling (D3-AM)	T1078	Knowing which identities can read which shares [1] (**Inferred**)
Account Locking (D3-AL)	T1078	Containment on 20 May; method not stated [1] (**Inferred**)
Network Resource Access Mediation (D3-NRAM)	T1039	Mediating access to the file share [1]
Decoy Network Resource (D3-DNR)	T1039	A decoy share could give the internal signal the record lacks [1] (**Inferred**)

Multi-factor Authentication (D3-MFA), in phishing-resistant forms, is what the entry vector points to, though the library does not map it to these techniques. Related mitigations: M1032 Multi-factor Authentication, M1017 User Training, M1022 Restrict File and Directory Permissions and M1057 Data Loss Prevention. See the D3FEND Reference.

Navigator layer

The study's Navigator layer is `navigator/library-layers/dentaquest-breach-2026.json` (open in Navigator), listed on the Navigator layers page. It is pinned to ATT&CK v20 Enterprise; scores measure the tie to this record (100 direct fit to a primary, 60 primary with partial fit, 40 Reported only), and each comment names its source numbers.

Cross-cutting themes

- **Identity is the perimeter for data theft.** As in Change Healthcare 2024, a weak authentication step opened a healthcare intermediary; here no ransomware followed [1] (**Inferred**).
- **Extortion without encryption.** DentaQuest kept running while its data was published, as in the Cl0p file-transfer breaches [1] [14] (**Inferred**).
- **Counts are contested by design.** Actors inflate, analysts count emails or deduped pairs, and victims file a floor [1] [13] [14] [21] (**Inferred**). Cite the regulator figure and say what the others measure.
- **Old data is live risk.** Files reportedly from 2009 [16] and children's SSNs [16] [17] outlast any monitoring offer (**Inferred**).
